

Task 7: Troubleshooting Log

Issue 1: SSH Connection Failed

Problem:

Unable to connect to the EC2 instance via SSH.

Cause:

The Security Group did not allow inbound traffic on port 22 from my IP address.

Solution:

Updated the Security Group inbound rules to allow SSH (port 22) access from my current public IP address. After updating the rule, the SSH connection was successful.

Issue 2: Nginx Web Page Not Accessible

Problem:

The Nginx welcome page could not be accessed through the browser using the EC2 public IP.

Cause:

HTTP traffic on port 80 was not allowed in the Security Group.

Solution:

Added an inbound rule allowing HTTP (port 80) traffic from anywhere (0.0.0.0/0). After the change, the webpage became accessible.

Issue 3: Nginx Service Not Running

Problem:

The web server was unreachable even after installing Nginx.

Cause:

The Nginx service was installed but not started.

Solution:

- Started the service using:
 - `sudo systemctl start nginx`
- Enabled it to start automatically on boot:
 - `sudo systemctl enable nginx`
- Verified the service status:
 - `sudo systemctl status nginx`
